BNSF: Sustainable Freight Transportation for Your Industrial Products Supply Chain

For nearly two centuries, BNSF Railway and its predecessors have been in the business of transporting first people, then the commodities and goods that helped develop the West. Today, our trains help deliver goods from all over the world.

We're a leader in our industry, thanks to a proven track record of providing rail services that meet our customers' changing needs. Our success is also based on our ability to continually evolve; in the early days we powered trains with steam, then diesel. On the horizon are next-generation battery-electric, potential hydrogen and other innovations in locomotives.

In short, our history and business model underscore the vital role we continue to play in building and supporting this nation's economy. And as a railroad, we're sustainable in another important way: We offer the most fuel-efficient method of moving freight over land.

That's right, no other form of land freight transportation is more resource- and fuel-efficient than rail.

Our Customers Care

Sustainability is increasingly influencing transportation choices among shippers. By using rail to transport goods, customers reduce emissions without sacrificing efficiency. That's where BNSF comes in.

Rail significantly reduces emissions because it is the most resource-efficient mode of land transportation. Across the board, railroads handle approximately 40% of the nation's long-distance freight volume, yet account for just 0.5% of total U.S. greenhouse gas (GHG) emissions and only 1.9% of the transportation-related sources, according to the U.S. Environmental Protection Agency (EPA).

Rail saves fuel and helps relieve highway congestion, moving freight more than three times as far as trucks per gallon of fuel and lowering GHG emissions up to 75%. On average, BNSF trains move one ton of freight nearly 500 miles on just one gallon of diesel fuel.

At BNSF, we take the benefits of rail a step further by constantly working to reduce our environmental impacts – while contributing to our customers' efforts to reduce their carbon footprint. In short, we don't stop where our customers' carbon reductions begin.

NEARLY
500
Miles

1
Gallon of
Diesel Fuel

More than 90% of our emissions come from our locomotives, so we look for ways to improve our fuel efficiency, explore renewable fuels and continue to advance hybrid and alternative technology. Another tenet of our carbon-reduction strategy is to make capital improvements that positively impact the environment and our communities.

Like other businesses around the world, we have submitted to set a science-based carbon emission reduction target via the Science Based Target initiative (SBTi). **BNSF is committed to reduce our emissions by 30% by 2030 against a 2018 baseline.**

We Care

Choosing to ship with BNSF can be part of our customers' – or potential customers' – strategy to achieve significant air emissions avoidance within their supply chain and thereby reduce their carbon footprint. We can back it up with numbers to help quantify the environmental benefits of rail compared with long-haul trucking as more companies look for ways to better understand and minimize their supply chain impacts.

Our carbon estimator method shows customers just how much they can reduce GHG emissions by putting their shipments on rail instead of the highway. We compare the difference of carbon emissions produced by rail vs. what is produced by truck. In 2022, our customers reduced total carbon emissions by 23.9 million metric tons by shipping with BNSF. That's the equivalent of taking 5.2 million vehicles off the road annually.

No matter what our customers are shipping, BNSF has a service to meet their needs, consistently, cost-effectively and – of growing importance – with the most sustainable mode of land transportation options possible.

With our Industrial Products customers, we are helping to support new sustainable business markets built around the circular economy, where materials are perpetually reused in closed-loop supply chains and upcycled into higher-value goods.

In 2022, our customers reduced total carbon emissions by 23.9 million metric tons by shipping with BNSF. That's the equivalent of taking 5.2 million vehicles off the road annually.

We look to integrate rail solutions into these sustainable business markets, including low-carbon cement, renewable fuels, recyclable plastics, as well as materials for emerging power sources, such as solar panels and lithium-ion batteries.

One example of how this works happened in 2021, when our Sustainable Business Market team partnered with a wind farm owner to test a wind blade removal and recycling plan. Once cut and loaded, the parts were transported to a recycling center where they were mixed with paper and packing scrap to create an alternative fuel for cement kilns.

BNSF has historically been a sustainable mode of transport for low-carbon renewable fuels, such as renewable diesel, biodiesel, renewable naphtha, and sustainable aviation fuel. We also support the shipment of renewable fuels and their feedstocks, such as vegetable oils, recycled animal fats, used cooking oils and greases. One loaded tank car holds roughly 30,000 gallons, offering a safe and efficient way to transport both renewable fuels and feedstocks while reducing carbon emissions.

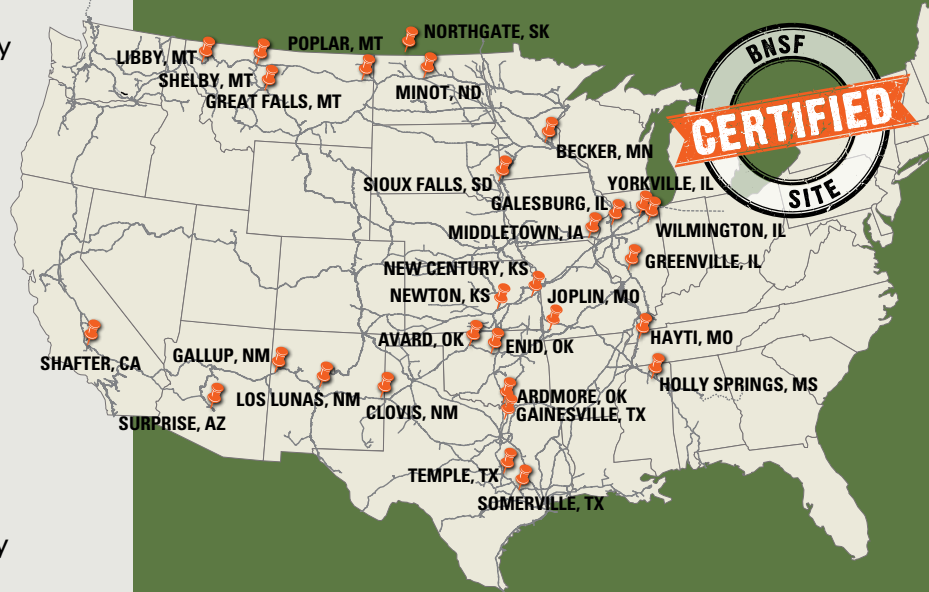

Another way we help our Industrial Products customers reduce their environmental impact is through our Logistics Centers and Certified Sites, which create a more sustainable, streamlined supply chain for our customers by locating them near growing markets.

Logistics Centers: These are multi-customer, multi-commodity business parks that offer direct rail in growing markets. They offer more choices, flexibility and efficiency and are created in partnership with our customers to streamline service and supply chains, enable rapid growth, save significant development time, increase speed-to-market and provide reliable and cost-effective services. Logistics Centers are also highly efficient, which reduces emissions and environmental impact and generates sustainable value for everyone.

BNSF Center of Excellence for Planning Permitting & Sustainability: BNSF has a small team of internal subject matter experts that thoroughly assess potential environmental, social and economic impacts, risks and opportunities associated with these locations to help ensure they are as sustainable as possible.

BNSF Certified Sites: These are areas of land adjacent to our network ready-made for customer development. They reduce entry barriers for customers to gain access to rail-served sites and benefit from their efficiencies. BNSF identifies real estate that could be readily connected to our network and studies environmental and social factors—such as wetland inventories and community outreach—to minimize potential impacts that could delay or stop a development project. Once a site is studied, it is certified and ready for development. BNSF’s certified site process streamlines customers’ development processes and ensures BNSF can operate with the utmost safety and efficiency with the least amount of environmental impact. Currently, BNSF has 33 Certified Sites available and ready for development.

For those considering transporting goods by rail, the benefits to the environment go beyond fuel efficiency; reducing supply chain costs also allows American businesses to be more competitive in the global market.

Efficiency = Reduced Emissions

By its very nature, rail is the most fuel- and resource-efficient land transportation method available for moving goods long distances. There are several key factors that contribute to these inherent efficiencies, which we build upon by adopting new technology, implementing and improving work practices, and enhancing the efficiency of our trains.

Energy-Efficient Engines:

Diesel electric locomotives—a string of locomotives pulling a train that use a combination of diesel combustion engines and electric traction motors—decrease fuel use.

Reduced Rolling Friction:

Trains' steel wheels running on steel tracks create less rolling resistance than other forms of land transportation.

Horsepower per Ton Optimization:

BNSF optimizes the number of locomotives on each train based on the weight of the trailing freight, reducing unnecessary horsepower to improve the fuel efficiency of each train.

Weight Reduction:

Over the years, the industry has improved aerodynamics and reduced overall weight of the freight rail car components, and we've realized improved fuel efficiency because less locomotive horsepower is required to move a train.

Energy-Efficient Locomotives:

Because railroads run on diesel, the pursuit of energy efficiency is one of our top priorities to reduce both our environmental impact and our operating costs. Because more than 90% of BNSF's emissions come from our locomotives, we look at locomotive technologies to improve our fuel efficiency. As such, we have made a significant investment in three key areas of locomotive technology: new locomotives, Automatic Start/Stop (AESS) systems, and Energy Management Systems (EMS).

Battery-Electric Locomotives: To reduce our environmental impact, increase our fuel efficiency and lower our operational costs, BNSF is developing the next generation of locomotives. In 2018, the California Air Resource Board awarded BNSF and the San Joaquin Valley Air Pollution Control District a \$22.6 million grant to develop a battery-electric locomotive. We worked with the San Joaquin Valley Air Pollution Control District and Wabtec to develop and test a 100% battery-electric locomotive. Paired with conventional diesel-electric locomotives, the prototype was piloted in Southern California and met our expectations for efficiency performance and confirmed that we will continue to explore the potential of this technology. At BNSF, we're doing more than just helping to reduce our customers' carbon emissions. We're also leading the way when it comes to sustainable practices.

New Locomotives: BNSF is proud to have the largest number of the newest and cleanest emissions locomotives in North America, including more than 300 Tier 4 locomotives purchased since 2015 when new EPA standards took effect.

AESS: More than 99% of our locomotives are equipped with automatic engine start/stop (AESS) devices, which shut down a locomotive that is idling to minimize wasted fuel while the locomotive is not pulling freight. The AESS will then automatically restart the locomotive if it is needed for power or if it is necessary for the health of the engine.

EMS: We have also equipped more than 4,000 locomotives with Energy Management Systems (EMS), which allows throttles and dynamic brakes to be controlled automatically, similar to cruise control in an automobile. EMS factors in the train makeup and speed restrictions to determine the most fuel-efficient way to operate a train across a territory while maintaining appropriate train handling. Additionally, we are integrating EMS with Positive Train Control (PTC), to maximize the utilization of EMS and minimize fuel consumption.

Practice, Practice, Practice

Not only do we invest in new environmentally efficient technologies to use in our operations, but we also practice good housekeeping and other compliance protocols to do our part on the front line.

Here are just a few examples:

People Power

Every day, our machinists maintain locomotives and railcars to keep them in top condition, track crews lubricate rails to reduce friction between the wheels and the rails, and locomotive engineers shut down idling locomotives or adjust acceleration and braking to conserve fuel.

Recycle, Reduce, Renew

In 2022, our railroad recycled approximately 2.8 million railroad ties, 1.2 million pounds of batteries and 2.6 million gallons of lube oil.

Audit Teams

BNSF teams regularly audit facilities and participate in risk-mitigation efforts, as well as follow environmental stewardship practices.

Sustainability with our Suppliers

We communicate and collaborate with our suppliers about sustainability. As part of the BNSF procurement process, economic, community and environmental components are assessed to consider the future implications of our actions.

Engineering in Green

Sustainable technologies and practices extend beyond the equipment that rides on top of our rail. We also engineer “green” into our projects, using design and vegetation management principles that have the least impact to the environment. Here are some examples:

Renewable Energy

To power some of our facilities, we use these forms of energy where they are practical and available.

Keeping It Fluid

We look holistically at our network to understand where investments are needed most in infrastructure, especially to eliminate a traffic chokepoint. Additional track allows faster trains to pass slower trains, plus it enables us to perform track maintenance without holding trains. By eliminating the time trains are held, we decrease locomotive idle times, reducing carbon emissions.

Reducing the Queue

Similarly, when we build a new fueling track in the middle of our network, we reduce the amount of time trains are in queue for refueling – improving network fluidity and reducing emissions.

View from Above

As part of our permitting process, drones help us analyze site conditions from hundreds of feet above, a much less invasive and more cost-effective practice.

Going the Distance for Our Communities

Sustainable freight is the right choice for those making transportation decisions, not just because it's good business but because it's right for our families and communities – now and for future generations. At BNSF, we do our part to make positive impacts on the communities where we live and work.

For example, we work closely with communities by consulting them on an array of matters concerning our operations and properties, ranging from environmental impacts to noise pollution and site planning. This engagement helps us understand needs and expectations, which improves our social license to operate and efficiently manage and develop our network.

Many of our facilities are located on legacy sites where predecessor railroads and other companies may have conducted operations for up to a century. We address environmental impacts at our facilities regardless of their

origin, and work directly with communities, regulatory agencies and other key stakeholder groups to actively manage and track our efforts.

In the last decade, **BNSF has invested approximately \$345 million toward remediation of our legacy sites, and we have rehabilitated and/or closed approximately 150 sites.** We are currently developing new metrics to measure our progress, and we remain committed to enhancing our approach to land management, so we continue to operate in a way that benefits local communities and economies.

Another way we invest in our communities is

through the BNSF Railway Foundation, which has long supported nonprofits that promote natural resource stewardship. One that we've worked with for many years is the National Fish and Wildlife Foundation. **Since 2015, we've contributed to projects that protect and restore wildlife and their habitats, promote job creation, improve water quality, reduce flood risks and more.**

We also challenge ourselves to find ways to support sustainability, sometimes in the most unlikely of places. In 2020, when we learned about the Rio Grande Valley Reef, an artificial reef under construction off the coast of Texas' South Padre Island, we saw an opportunity to recycle our concrete ties in a particularly helpful way. We donated more than 60,000 used concrete ties to help build an approximately one square mile section of artificial reef, where more than a quarter million fish, primarily red snapper, will make a home.

We're in This Together

What we at BNSF do today – the investments in our network, the technologies we test, the partnerships we make, the processes and programs we undertake – we do for the “long haul.” We, like all influential companies, recognize that **our actions have long-standing consequences.**

What we transport touches individuals in all walks of life. We are committed to ensuring that our operations contribute to **cleaner and more efficient supply chain solutions** for our customers and their customers.
